Agile development is a term that covers several different developmental methodologies. Agile methods focus on helping people collaborate and work together, as well as make quick and efficient decisions. They are all very lightweight and adaptable compared to the normal waterfall process. The waterfall method is a design method that consists of multiple steps in phase that move downward like a waterfall in the diagram. Agile Is a more dynamic process where all of the steps can be deviated and worked on at the same time. In The waterfall method you must complete the first step to move on to the second and so on.
